Q1-A :- Select the suitable answer for the following points:-

(10 marks)

1-When we classify the IC engine according to the fuel type we will say:-

- a- Spark ignition, self-ignition, and compression ignition.
- b- Four stroke, two strokes.
- c- A&b.
- d- Neither a, nor b.
- 2- The equation used to determine the piston travel of the offset crank gear is:
 - a- $X_p = R[(1 \cos \phi) + \lambda(1 \cos 2\phi) + (k\lambda \sin \phi)]$
 - b- $X_p = R[(1 \cos \phi) + (\lambda/4)(1 \cos 2\phi) + (k\lambda \sin \phi)]$
 - c- $X_p = R[(1 \cos \phi) + (\lambda/4)(1 \cos 2\phi)]$
 - d- No one from the above equations.

3- The natural (free) vibration of a system is a vibration that occurs in the absence of:-

- a- Stiffness.
- b- Damping.
- c- External force.
- d- Acceleration.

4- The vehicle movement around the vertical axis called:-

- a- Vertical vibration.
- b- Yawing.
- c- Longitudinal vibration.
- d- Rolling.

5- The logarithmic decrement is the natural logarithmic of the ratio of:-

- a- X_1/X_o
- b- X₂/ X₁
- c- X_o/ X₁
- d- No one of the above points

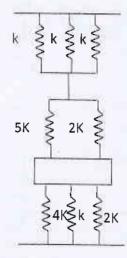

21-B:-prove that the piston acceleration (a_p) as a function of the crank angle ϕ :-

$$a_p = R\omega^2 \left[(\cos \varphi) + (\lambda) (\cos 2\varphi) \right] \qquad (10 \text{ marks})$$

Q2:- A vibration system as shown in fig. below have a mass (50kg) and (k = 1000N/m),

What is the natural frequency?

(20 marks)

Q3:- Find torque for the engine with following data:-

m_p =0.9 kg, m_{rod} = 1.36 kg, l_{rod} 203 mm, cg at 50 mm from the crank pin center, ϕ =75 °

N = 2500 r.p.m. R=50 mm

Q4:- The following data are given for a vibrating system with viscous damping,

*f*_d =2.3 Hz

K =5000 N/m

m=20 kg

Determine the logarithmic decrement and the ratio of any two successive oscillations.

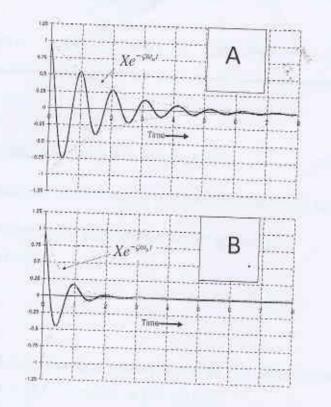

(20 marks)

Q5 :- An automobile engine test to recording the free vibration response, the engine weight is **500 kg** mounted on deferent types of foundation the recording shown in fig. below (a) and (b). Identify the following in each case

- i) Logarithmic decrement in each case.
- ii) The spring and damper constants.
- iii) An- damped and damped frequency.

Time: 3 Hour Date: / / 2016

Q.2 The vertical scale of the turning moment diagram for a multi-cylinder engine working on the four stroke cycle, is 1 cm = 7000 Nm of torque, and horizontal scale is $1 \text{ cm} = 30^{\circ}$ of crank rotation. The areas (in cm²) of the turning moment diagram above and below the mean resistance line, starting from A in and taken in order, are 0.5, +1.2, -0.95, +1.45, -0.85, +0.71, -1.06. The engine speed is 800 rpm and it is desired that the fluctuation from minimum to maximum speed should not be more than 2% of average speed, also the coefficient of fluctuation of energy not exceed than 0.15. Determine the moment of inertia of the flywheel and the mean torque may be obtained by the engine.

Notes/// 1. Answer all questions 2 Allow Using Information 3 All questions have the same marks

Q.3 A multi-plate clutch has four plates with friction surfaces on each side. Each spring used provides a spring force of 300 N, and the assembly has six springs in it. The internal radius of the friction material is 40 mm and the external radius is 100 mm. The coefficient of friction between the materials is estimated to be 0.45. Determine the power that this clutch could transmit when running at 2400 rev/min.

Q.4 A single square thread power screw is to raise a load of 50 KN with 2600 Watt power input to the screw. A screw thread of major diameter of 34 mm and a pitch of 6 mm is used. The coefficient of friction at the thread and collar are 0.15 and 0.1 respectively. If the screw turns at a speed of 1 rev/s find:

(a) The collar mean radius.

(b) The combined efficiency of the screw and collar.

Q.5 A driving shaft is joined with coaxial driven shaft through a muff coupling. The shaft transmits 60 kW of power at 150 rpm. Design the shaft, key and muff. Assume a factor of safety of 5 with following ultimate strength values.

Ultimate shear strength for shaft = 300 N/mm^2

Ultimate shear strength for key = 200 N/mm^2

Ultimate shear strength for $muff = 50 \text{ N/mm}^2$

Ultimate compressive strength for key = 500 N/mm^2
