Building and Construction Engineering Department

## Subtraction of angles

| 1 | $48^{\circ} 15^{\prime} 38^{\prime \prime}$ <br> $-15^{\circ} 09^{\prime} 21^{\prime \prime}$ |
| :--- | :--- |

3 | $48^{\circ} 15^{\prime} 38^{\prime \prime}$ |
| ---: |
| $\frac{-15^{\circ} 09^{\prime} 21^{\prime \prime}}{} 06^{\prime} 17^{\prime \prime}$ |

4 | $48^{\circ} 15^{\prime} 38^{\prime \prime}$ |
| ---: |
| $\frac{-15^{\circ} 09^{\prime} 21^{\prime \prime}}{33^{\circ} 06^{\prime} 17^{\prime \prime}}$ |

## Subtraction of angles

## Vertical Angle (V)

- The vertical angle is the angle between the horizon line and the direction of the guiding line. The theodolite device does not measure the vertical angle directly, but rather reads a certain reading on the vertical circle and it is called the reading of the vertical circle( $\alpha$ ) and through this reading the value of the vertical angle can be obtained according to the monitoring position of the device (F.L or F.R), as follows:

## 1- F.L Mode

$$
V=90-\alpha \quad \text { The two case at F.L }
$$

2-F.R Mode

- Example1: the vertical circle readings from the station A at the points $B, C, D$ respectively as shown in table below :

| Theodolite station | Observed point | Horizontal circle readings |  |
| :---: | :---: | :---: | :---: |
|  |  | F.L | F.R |
| A | B | $85^{\circ} 14^{\prime} 10^{\prime \prime}$ | $274^{\circ} 45^{\prime} 10^{\prime \prime}$ |
|  | C | $93^{\circ} 27^{\prime} 14^{\prime \prime}$ | $266^{\circ} 32^{\prime} 36^{\prime \prime}$ |
|  | D | $97^{\circ} 18^{\prime} 50^{\prime \prime}$ | $262^{\circ} 41^{\prime} 18^{\prime \prime}$ |

If the theodolite height at station $A=1.5 \mathrm{~m}$, and the elevation of point $A$ was 30 m . Find the elevation of points $B, C$ and $D$ if you know that the horizontal distance to these points ( $B, C$ and D)were equal to (50,100 and 150) m respectively ?

SOLUTION :
Line $A B$ :

$$
\begin{aligned}
& \text { V at } F . L=90-\alpha=90-85^{\circ} 14^{\prime} 10^{\prime \prime}=4^{\circ} 45^{\prime} 50^{\prime \prime} \\
& \text { V at } F . \mathrm{R}=\alpha-270=274^{\circ} 45^{\prime} 10^{\prime \prime}-270=4^{\circ} 45^{\prime} 10^{\prime \prime} \\
& V_{\text {final }}=\frac{V \text { at } F . L+V \text { at } F . R}{2}=\frac{4^{\circ} 45^{\prime} 50^{\prime \prime}+4^{\circ} 45^{\prime} 10^{\prime \prime}}{2}=+4^{\circ} 45^{\prime} 30^{\prime \prime} \text { زاوية الارنفاع }
\end{aligned}
$$

Elev. $\mathrm{B}=$ Elev. $\mathrm{A}+\mathrm{H} . \mathrm{I}+\mathrm{H}$
But $\mathrm{H}=50 \tan \mathrm{~V}$

$$
\begin{aligned}
& =50 \tan 4^{\circ} 45^{\prime} 30^{\prime \prime} \\
& =4.162 \mathrm{~m}
\end{aligned}
$$

Elev. $\mathrm{B}=30+1.5+4.162$

$$
=35.622 \mathrm{~m}
$$

50 m

## Line CA:

V at $\mathrm{F} . \mathrm{L}=90-\alpha=90-93^{\circ} 27^{\prime} 14^{\prime \prime}=-3^{\circ} 27^{\prime} 14^{\prime \prime}$
V at $\mathrm{F} . \mathrm{R}=\alpha-270=266^{\circ} 32^{\prime} 36^{\prime \prime}-270=-3^{\circ} 27^{\prime} 24^{\prime \prime}$
$V_{\text {final }}=\frac{V a t F . L+V a t F . R}{2}=\frac{-3^{\circ} 27^{\prime} 14^{\prime \prime}+\left(-3^{\circ} 27^{\prime} 24^{\prime \prime}\right)}{2}=-3^{\circ} 27^{\prime} 19^{\prime \prime} \quad$ زيـة الانخفاض
Elev. $\mathrm{C}=$ Elev. A $+\mathrm{H} . \mathrm{I}-\mathrm{H}$
But $\mathrm{H}=100 \tan \mathrm{~V}=100 \tan -3^{\circ} 27^{\prime} 19^{\prime \prime}=-6.038 \mathrm{~m}$
Elev. $\mathrm{C}=30+1.5-6.038=25.462 \mathrm{~m}$

Line DA:
V at F.L $=90-\alpha=90-97^{\circ} 18^{\prime} 50^{\prime \prime}=-7^{\circ} 18^{\prime} 50^{\prime \prime}$
V at F.R $=\alpha-270=262^{\circ} 41^{\prime} 18^{\prime \prime}-270=-7^{\circ} 18^{\prime} 42^{\prime \prime}$

$$
V_{\text {final }}=\frac{V \text { at } F . L+V \text { at } F . R}{2}=\frac{-7^{\circ} 18^{\prime} 50^{\prime \prime}+\left(-7^{\circ} 18^{\prime} 42^{\prime \prime}\right)}{2}=-7^{\circ} 18^{\prime} 46^{\prime \prime}{ }^{\prime \prime} \text { الانخفاض }
$$

Elev. $\mathrm{D}=$ Elev. $\mathrm{A}+\mathrm{H} . \mathrm{I}-\mathrm{H}$
But $\mathrm{H}=150 \tan \mathrm{~V}=150 \tan \left(-7^{\circ} 18^{\prime} 46^{\prime \prime}\right)=-19.249 \mathrm{~m}$
Elev. $\mathrm{D}=30+1.5-19.249=12.25 \mathrm{~m}$

- Example2 : the point B was observed from station A by using A theodolite instrument, and the readings was as follow :

| Theodolite station | Observed point | Horizontal circle readings |  |
| :--- | :--- | :--- | :--- |
|  |  | F.L | F.R |
| A | B | $81^{\circ} 20^{\prime} 10^{\prime \prime}$ | $278^{\circ} 40^{\prime} 20^{\prime \prime}$ |

If point A elevation was 40 m , the theodolite height over this point (HI) was 1.5 m , and the horizontal distance of line $A B$ was 100 m , find the elevation of point $B$ ?. SOLUTION:

$$
\begin{aligned}
& V \text { at } F . \mathrm{L}=90-\alpha=90-81^{\circ} 20^{\prime} 10^{\prime \prime}=8^{\circ} 39^{\prime} 50^{\prime \prime} \\
& V \text { at } \mathrm{F} . \mathrm{R}=\alpha-270=278^{\circ} 40^{\prime} 20^{\prime \prime}-270=8^{\circ} 40^{\prime} 20^{\prime \prime} \\
& V_{\text {final }}=\frac{V \text { at } F . L+V \text { at } F . R}{2}=\frac{8^{\circ} 39^{\prime} 50^{\prime \prime}+8^{\circ} 40^{\prime} 20^{\prime \prime}}{2}=8^{\circ} 40^{\prime} 05^{\prime \prime}
\end{aligned}
$$

Elev. B = Elev. A + H.I + H
But $\mathrm{H}=100 \tan \mathrm{~V}=100 \tan \left(8^{\circ} 40^{\prime} 05^{\prime \prime}\right)=15.245 \mathrm{~m}$
Elev. $\mathrm{B}=40+1.5+15.245=56.745 \mathrm{~m}$

- Example 3 : What is the height of a certain building if it was observed by a theodolite instrument and the readings were as follow:

| $\begin{array}{c}\text { Theodol } \\ \text { ite } \\ \text { position }\end{array}$ | Observed point | Horizontal circle readings |  | $\begin{array}{c}\text { The horizontal } \\ \text { distance from the }\end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| theodolite station to |  |  |  |  |
| the building |  |  |  |  |$]$

## SOLUTION:

- Line MA which directed to the top of the building :

$$
\begin{aligned}
& V \text { at } \mathrm{F} . \mathrm{L}=90-\alpha=90-54^{\circ} 12^{\prime} 36^{\prime \prime}=35^{\circ} 47^{\prime} 24^{\prime \prime} \\
& \mathrm{V} \text { at } \mathrm{F} . \mathrm{R}=\alpha-270=305^{\circ} 47^{\prime} 30^{\prime \prime}-270=35^{\circ} 47^{\prime} 30^{\prime \prime} \\
& V_{\text {final }}=\frac{V \text { at } F . L+V \text { at } F . R}{2}=\frac{35^{\circ} 47^{\prime} 24^{\prime \prime}+35^{\circ} 47^{\prime} 30^{\prime \prime}}{2}=35^{\circ} 47^{\prime} 27^{\prime \prime}
\end{aligned}
$$

- Line MB which directed to the top of the building :

V at F.L $=90-\alpha=90-93^{\circ} 14^{\prime} 53^{\prime \prime}=-3^{\circ} 14^{\prime} 53^{\prime \prime}$
V at F.R $=\alpha-270=266^{\circ} 45^{\prime} 19^{\prime \prime}-270=-3^{\circ} 14^{\prime} 41^{\prime \prime}$
$V_{\text {frual }}=\frac{V a t F . L+V \text { at } F . R}{2}=\frac{-3^{\circ} 14^{\prime} 53^{\prime \prime}+\left(-3^{\circ} 14^{\prime} 41^{\prime \prime}\right)}{2}=-3^{\circ} 14^{\prime} 47^{\prime \prime}$
(H) $=\mathrm{H}_{1}+\mathrm{H}_{2}$
$\mathrm{H}_{1}=20 \tan \mathrm{~V}_{1}$
$=20 \tan 35^{\circ} 47^{\prime} 27^{\prime \prime}=14.42 \mathrm{~m}$
$\mathrm{H}_{2}=20 \tan \mathrm{~V}_{2}$
$=20 \tan \left(-3^{\circ} 14^{\prime} 47^{\prime \prime}\right)=1.134 \mathrm{~m}$

$$
\mathrm{H}=\mathrm{H}_{1}+\mathrm{H}_{2}=14.42+1.134=15.554 \mathrm{~m}
$$

- Example 4 : if point A was located at the top of building of 15 m height, while point B was located at the bottom of this building. What is the theodolite readings for the vertical circle at the F.R and F.L mode for both point $A$ and $B$, ( $\mathrm{HI}=1.5$ ).

## Solution :

Line MA which directed to the top of the building :
$\mathrm{V}_{1}=\tan ^{-1} \frac{13.5}{20} \Rightarrow \mathrm{~V}_{1}=34^{\circ} 01^{\prime} 10^{\prime \prime}$
$\mathrm{V}_{1}$ at F.L $=90-\alpha_{1} \rightarrow 34^{\circ} 01^{\prime} 10^{\prime \prime}=90-\alpha_{1} \rightarrow \alpha_{1}=55^{\circ} 58^{\prime} 50^{\prime \prime}$
$\mathrm{V}_{1}$ at $\mathrm{F} . \mathrm{R}=\alpha_{1}-270 \rightarrow 34^{\circ} 01^{\prime} 10^{\prime \prime}=\alpha_{1}-270 \rightarrow \alpha_{1}=309^{\circ} 01^{\prime} 10^{\prime \prime}$
Line $M B$ which directed to the top of the building :
$\mathrm{V}_{2}=\tan ^{-1} \frac{1.5}{20} \Rightarrow \mathrm{~V}_{2}=-4^{\circ} 17^{\prime} 21^{\prime \prime}$
$\mathrm{V}_{2}$ at F.L $=90-\alpha_{2} \boldsymbol{\rightarrow}-4^{\circ} 17^{\prime} 21^{\prime \prime}=90-\alpha_{2} \boldsymbol{\rightarrow} \alpha_{2}=94^{\circ} 17^{\prime} 21^{\prime \prime}$
$\mathrm{V}_{2}$ at $\mathrm{F} . \mathrm{R}=\alpha_{2}-270 \boldsymbol{\rightarrow}-4^{\circ} 17^{\prime} 21=\alpha_{2}-270 \rightarrow \alpha_{2}=265^{\circ} 42^{\prime} 39$

Example5: If the vertical angle reading for a point located at 3.668 m above point B was equal to ( $-2^{\circ} 9^{\prime} 00^{\prime \prime}$ ). The telescope of theodolite was at 1.52 height above point $A$, and the horizontal distance of $A B$ was equal to 60 m , point $B$ elevation $=53.6 \mathrm{~m}$. find the elevation of point $A$. solution :

$$
\begin{aligned}
& \mathrm{V}=-2^{\circ} 9^{\prime} 00^{\prime \prime} \\
& \begin{array}{l}
\Delta \mathrm{H}=3.668 \mathrm{~m} \\
\mathrm{H} . \mathrm{I}=1.52 \mathrm{~m} \\
\mathrm{H}=60 \tan -2^{\circ} 9^{\prime} 00^{\prime \prime} \\
\\
=2.253 \mathrm{~m}
\end{array}
\end{aligned}
$$

Elev. A + H.I = Elev. B $+\Delta \mathrm{H}+\mathrm{H}$
Elev. $\mathrm{A}+1.52=53.6+3.668+2.253 \rightarrow$ Elev. $\mathrm{A}=58 \mathrm{~m}$
